Project demonstration phase

Import Data using Transform Maps (Spreadsheet)

This SkillWallet micro project focuses on importing structured employee data from an external spreadsheet into the ServiceNow platform using Import Sets and Transform Maps. The spreadsheet is first loaded into an Import Set staging table. A Transform Map then maps source fields to the appropriate target-table fields, after which the transformation is executed and the target records are validated. The project also includes coalesce-based duplicate prevention and reporting/dashboard work.

1. Demonstration objective

- The demonstration should show the complete project workflow from the source spreadsheet through the ServiceNow staging table, Transform Map, transformation, validation, and final reporting.

2. Demonstration sequence

- Start by introducing the project title and objective.
- Show the spreadsheet containing the structured employee data.
- Open the ServiceNow Import Set process and show the loaded/staging data.
- Open the Transform Map and explain the source table, target table, and field mappings.
- Show the coalesce configuration used for duplicate prevention.
- Run the transformation.
- Open the transform result/history and explain the outcome.
- Open the target table and verify representative records.
- Finish by showing the reports/dashboard created for the project.

3. Points to explain during presentation

- Why a staging table is used.
- What the Transform Map does.
- How Field Maps connect source and target fields.
- Why coalesce is useful for avoiding duplicate records.
- Why validation is required after transformation.
- How reports/dashboard views help present the result.

4. Demonstration checklist

- Source spreadsheet is ready.
- Import Set table contains the imported rows.

- Transform Map is active/configured.
- Field mappings are correct.
- Coalesce setting is visible and explained.
- Transform can be run successfully.
- Target records can be verified.
- Reports/dashboard are available.
- Screenshots/documentation are ready as backup evidence.

5. Final outcome

- The demonstration should clearly communicate that the project implements an end-to-end spreadsheet data import and transformation workflow in ServiceNow and that the resulting records have been validated.

Reference note: The technical descriptions of Import Sets, Transform Maps, field mapping, coalesce, transformation, and transform-history validation are aligned with ServiceNow developer/community guidance.
