# Project design phase

### Import Data using Transform Maps (Spreadsheet)

This SkillWallet micro project focuses on importing structured employee data from an external spreadsheet into the ServiceNow platform using Import Sets and Transform Maps. The spreadsheet is first loaded into an Import Set staging table. A Transform Map then maps source fields to the appropriate target-table fields, after which the transformation is executed and the target records are validated. The project also includes coalesce-based duplicate prevention and reporting/dashboard work.

## 1. Design overview

- The project is designed as a simple end-to-end ServiceNow data-import workflow.
- The design separates incoming spreadsheet data from final ServiceNow records by using an Import Set staging table.
- A Transform Map is used as the central mapping layer between the staging data and the target table.

## 2. High-level data flow

- External spreadsheet → Import Set staging table → Transform Map → Target ServiceNow table → Validation and reporting.
- This structure makes the data flow easier to understand, test, troubleshoot, and demonstrate.

## 3. Main design components

- Spreadsheet data source containing structured employee information.
- Import Set table acting as a temporary staging area.
- Transform Map defining source-to-target field relationships.
- Field Maps for individual source and target fields.
- Coalesce configuration to identify existing records and reduce duplicate creation.
- Target table containing the transformed records.
- Reports and dashboards for presenting project results.

## 4. User and system view

- The administrator/system user performs the import configuration and transformation activities.
- The system processes the spreadsheet data, applies the mapping rules, creates or updates target records, and provides transformation history for verification.

## 5. Design considerations

- Keep source fields clearly named and consistently formatted.

- Use a unique field for coalescing when duplicate prevention is required.
- Validate imported rows before relying on the transformed records.
- Keep the dashboard/reporting layer focused on useful project results.

Reference note: The technical descriptions of Import Sets, Transform Maps, field mapping, coalesce, transformation, and transform-history validation are aligned with ServiceNow developer/community guidance.
