# Project development phase

### Import Data using Transform Maps (Spreadsheet)

This SkillWallet micro project focuses on importing structured employee data from an external spreadsheet into the ServiceNow platform using Import Sets and Transform Maps. The spreadsheet is first loaded into an Import Set staging table. A Transform Map then maps source fields to the appropriate target-table fields, after which the transformation is executed and the target records are validated. The project also includes coalesce-based duplicate prevention and reporting/dashboard work.

## 1. Development objective

- The development phase converts the approved project design into a working ServiceNow implementation.
- The implementation follows the project milestones shown in the SkillWallet workspace.

## 2. Development steps

- Prepare the spreadsheet containing structured employee data.
- Load the spreadsheet through the ServiceNow Import Set process.
- Create or configure the Import Set staging table.
- Create the Transform Map and select the appropriate target table.
- Create field mappings between source and target fields.
- Enable coalesce on the selected unique field where duplicate prevention is required.
- Run the transformation and review the result.
- Create reports and dashboard elements for the final demonstration.

## 3. Development output

- A working Import Set table with the uploaded spreadsheet records.
- A configured Transform Map with source-to-target field mappings.
- A successful transformation process.
- Validated target records.
- Reports/dashboard components that summarize the imported data.

## 4. Development practices

- Build one milestone at a time and verify it before moving to the next.
- Use clear names for tables, Transform Maps, and reports.
- Check the transform history instead of assuming that a successful run means every record is correct.

- Correct mapping or data-format issues before repeating the final demonstration.

Reference note: The technical descriptions of Import Sets, Transform Maps, field mapping, coalesce, transformation, and transform-history validation are aligned with ServiceNow developer/community guidance.
