Project testing phase

Import Data using Transform Maps (Spreadsheet)

This SkillWallet micro project focuses on importing structured employee data from an external spreadsheet into the ServiceNow platform using Import Sets and Transform Maps. The spreadsheet is first loaded into an Import Set staging table. A Transform Map then maps source fields to the appropriate target-table fields, after which the transformation is executed and the target records are validated. The project also includes coalesce-based duplicate prevention and reporting/dashboard work.

1. Testing objective

- Testing verifies that the spreadsheet data is loaded correctly, the mapping behaves as intended, the transform executes successfully, duplicate handling works, and the final records are accurate.

2. Test cases

- Test Case 1: Load a valid spreadsheet and verify that records appear in the Import Set table.
- Test Case 2: Check that source fields are mapped to the intended target fields.
- Test Case 3: Run the Transform Map and verify that target records are created or updated.
- Test Case 4: Re-import matching data and verify the selected coalesce field prevents unintended duplicate records.
- Test Case 5: Review transform history and confirm that row errors are investigated.
- Test Case 6: Compare selected source values with target records to confirm data accuracy.
- Test Case 7: Verify that reports/dashboard components display the expected records.

3. Validation approach

- Check the staging table before transformation.
- Check the Transform Map and Field Map configuration.
- Check the transform result and transform history.
- Check the target table after transformation.
- Check duplicate behavior by using a repeated unique value in a controlled test.

4. Expected test result

- Valid records should reach the correct target fields, duplicate handling should behave according to the coalesce configuration, and any errors should be identifiable through the ServiceNow import/transform history.

5. Testing conclusion

- The project is considered ready for demonstration when the complete workflow can be repeated without unexplained errors and the target records have been manually validated.

Reference note: The technical descriptions of Import Sets, Transform Maps, field mapping, coalesce, transformation, and transform-history validation are aligned with ServiceNow developer/community guidance.
