Requirement analysis phase

Import Data using Transform Maps (Spreadsheet)

This SkillWallet micro project focuses on importing structured employee data from an external spreadsheet into the ServiceNow platform using Import Sets and Transform Maps. The spreadsheet is first loaded into an Import Set staging table. A Transform Map then maps source fields to the appropriate target-table fields, after which the transformation is executed and the target records are validated. The project also includes coalesce-based duplicate prevention and reporting/dashboard work.

1. Functional requirements

- The system must accept structured data from an external spreadsheet.
- The imported data must first be stored in an Import Set/staging table.
- A Transform Map must connect source fields to target-table fields.
- The project must support execution of the transformation.
- The transformed records must be validated in the target table.
- The project must demonstrate duplicate prevention using coalesce.
- Reports and dashboards must be created as part of the final project output.

2. Data requirements

- The source spreadsheet should contain structured employee records with identifiable columns.
- Source values should use consistent formats so that they can be mapped correctly.
- At least one suitable unique field should be available when coalesce is used.

3. Technical requirements

- A ServiceNow instance with access to Import Sets and Transform Maps.
- A spreadsheet containing the project data.
- Permission to create/configure the required staging table, Transform Map, field mappings, and reports/dashboard components.

4. Validation requirements

- Imported rows should be reviewed in the staging table.
- Field mappings should be checked before transformation.
- Transform history and errors should be reviewed after execution.
- Target records should be checked for correct values and duplicate behavior.

5. Expected outcome

- The final system should demonstrate that external spreadsheet data can be loaded, transformed, validated, and presented in ServiceNow in a controlled end-to-end process.

Reference note: The technical descriptions of Import Sets, Transform Maps, field mapping, coalesce, transformation, and transform-history validation are aligned with ServiceNow developer/community guidance.
